Body fluid exposures carry a risk of transmitting HIV, HBV, and HCV. The risk of developing HIV after a needlestick injury involving an HIV-infected patient is around 0.3%.

## Inversor solar de 2000 W en venta en Senegal

HIV spreads through specific body fluids?blood, semen, vaginal fluids, rectal fluids, and breast milk?most commonly through unprotected sex, shared needles, or perinatal

Your risk of infection from the HIV virus after contact with blood and certain body fluids depends on many things, including the type of exposure and type of body fluid.

Any small wound or break in the skin is considered a potential entry point for blood or certain bodily fluids?vaginal fluids, semen, pre-seminal fluids, or rectal fluids?to transmit HIV.
